To determine what position(s) a particular electrode is qualified for, refer to the third digit in AWS classification. Here's how you decipher the qualified electrode position: 1 = flat, horizontal, vertical and overhead. 2 = flat and horizontal only. For example, a 7018 electrode can be used in the flat, horizontal, vertical and overhead positions.

Joint Preparation: The fourth factor to be considered while selecting an electrode is the joint preparation or groove configuration. If there is a tight fit-up or unbevelled root face then an electrode with a digging arc can be used, which can provide deeper penetration. Electrodes such as E6010 or E6011 can be used for this purpose.

The diameter of the balled end should not exceed 1.5 times the diameter of the electrode (for example, a 1/8-in. electrode should form a 3/16-in. diameter end), as having a larger sphere at the tip of the electrode can reduce arc stability and/or fall off and contaminate the weld.

Reference half-cells provide the reference potential needed for pH measurement. Our selection of electrodes includes a variety of reference cell options: Single- vs Double-Junction. In combination electrodes, the reference junction allows H ions to pass freely between the reference and sensing half-cells to complete the electrical circuit. Economical single-junction electrodes are ideal for general-purpose applications.
